Exercise 41.1: SELinux: Contexts

> **i** **Please Note**
>
> This exercise can only be performed on a system (such as **RHEL**) where **SELinux** is installed. While it is possible to install on **Debian**-based distributions, such as **Ubuntu**, it is not the easiest task and it is not often done.

1. Verify **SELinux** is enabled and in **enforcing** mode, by executing **getenforce** and **sestatus**. If not, edit `/etc/selinux/config`, reboot, and check again.

2. Install the **httpd** package (if not already present) which provides the **Apache** web server, and then verify that it is working:

   ```
   $ sudo yum install  httpd
   $ elinks http:/localhost
   ```

   (You can also use **lynx** or **firefox** etc. as the browser, or use your graphical browser such as **firefox** or **chrome**, in this and succeeding steps.)

3. As superuser, create a small file in `/var/www/html`:

   ```
   $ sudo sh -c "echo file1 > /var/www/html/file1.html"
   ```

4. Verify you can see it:

   ```
   $ elinks -dump http://localhost/file1.html
   ```

   ```
   file1
   ```

   Now create another small file in **root**'s home directory and **move** it to `/var/www/html`. (Do not copy it, move it!) Then try and view it:

   ```
   $ sudo cd /root
   $ sudo sh -c "echo file2 > file2.html"
   $ sudo mv file2.html /var/www.html
   $ elinks -dump http://localhost/file2.html
   ```

   ```
                             Forbidden

      You don't have permission to access /file2.html on this server.
   ```

5. Examine the security contexts:

   ```
   $ cd  /var/www/html
   $ ls -Z file*html
   ```

   ```
   -rw-r--r--. root root unconfined_u:object_r:httpd_sys_content_t:s0 file1.html
   -rw-r--r--. root root unconfined_u:object_r:admin_home_t:s0 file2.html
   ```

6. Change the offending context and view again:

   ```
   $ sudo chcon -t httpd_sys_content_t file2.html
   $ elinks http://localhost/file2.html
   ```

   ```
   file2
   ```
